Received May 11, 2004
The first direct synthesis of (+)-lysergic acid (2a) suitable for scaleup has been achieved by the following reaction sequence. Bromoketones $\mathbf{4 d}$ or $\mathbf{4 g}$ were allowed to react with amine $\mathbf{5}$ followed by deprotection, and the resulting di ketone $\mathbf{6 c}$ was transformed into the unsaturated ketone $( \pm)$ - $\mathbf{7}$ by the $\mathrm{LiBr} / E \mathrm{Et}_{3} \mathrm{~N}$ system. Resolution afforded (+)-7, which was further transformed by Schöllikopf's method into the mixture of esters $\mathbf{2 e}$ and $\mathbf{2 f}$. Upon hydrolysis the latter mixture afforded ( + )-2a. The peptide part of $\alpha$-ergocryptine (1) was prepared according to the Sandoz method; the stereoefficiency, however, has been significantly improved by applying a new resolution method and recycling the undesired enantiomer. Coupling the peptide part with lysergic acid afforded $\mathbf{1}$. Having synthetic (+)-7 in hand, we can claim the total synthesis of all the alkaloids which were prepared earlier from (+)-7 that had been obtained through degradation of natural lysergic acid.

## Introduction

"Ergot alkaloids, of which lysergic acid is representative, are particularly important as they possess the widest spectrum of biological activity found in any family of natural products". ${ }^{1}$ One of the biologically most important ergot alkaloids is $\alpha$-ergocryptine (1). Its semisynthetic derivative, the so-called bromocryptine, is one of the most widely used drugs in this family (e.g., as a prolactin inhibitor, or an anti-Parkinsonian). ${ }^{2}$ Great efforts have been devoted to the synthesis of ergot alkaloids during the second half of the last century. Conceptually, retrosynthetic cleavage of the central amide bond devides the problem into two parts, the synthesis of the lysergic acid and of the peptide dilactam moiety.

The first synthesis of racemic lysergic acid was effected by Woodward and K ornfeld in 1956. ${ }^{3,16}$ One of their main problems was to prepare ring C from the otherwise easily accessible 3-indolepropionic acid (3), since the ring closure of the corresponding acid chloride occurred at the more reactive pyrrole ring instead of the benzene ring. Thus the Woodward group reduced the pyrrole ring, the

[^0]
## SCHEME 1

amine was protected by benzoylation, and thereafter the ring closure took place regioselevtively as desired. The drawback of this approach is that sooner or later the pyrroline moiety must be reoxidized to a pyrrole ring. It is difficult to perform an enantioefficient synthesis as well, since the method involves introduction of an unnecessary chiral center by the reduction. The earlier described resolution of racemic compound needs further and rather inconvenient steps. ${ }^{4}$ Sofar thetotal synthesis of ( $\pm$ )-2a has been achieved by nine groups, but the number of publications dealing with the synthetic efforts is much higher. Among these approaches one can find about a dozen methods trying to construct the ergoline ring, some of which were successful; others remained at the level of attempt. ${ }^{5}$ Seven of the nine successful

[^1]syntheses used the reduced indoline derivative as the starting compound. Oppolzer et al. ${ }^{3}$ performed the first total synthesis avoiding the reduction step, but their procedure again cannot be scaled up. A second approach to the racemic acid was published recently. ${ }^{6}$

We decided to construct the ergol ine skeleton starting from indole, thus avoiding the reoxidation problem, and at the same time making an enantioefficient synthesis possible. ${ }^{7}$

An ideal starting material was the so-called Uhle's ketone (4a) having the intact indole ring, although the original synthesis of 4a is rather tedious. Uhle commenced with acetylation and subsequent bromination, and he claimed that the derived bromo-derivative 4b could be subjected successfully to a substitution reaction with various amines. ${ }^{9}$ E arly in the seventies Bowman and co-workers reinvestigated a few results of Uhle's synthesis and established that one of the key steps, alkylation of several types of amines with $\mathbf{4 b}$, always failed. ${ }^{10}$ The approach starting from 4a by Stoll used the Stobbe condensation as a key step, but the reaction sequence could not be carried out, ${ }^{11}$ thus the synthesis of lysergic acid starting from Uhle's ketone remained a challenge.

## Results and Discussion

(1) Synthesis of (+)-Lysergic Acid. In 1994 the N -pival oyl derivative of Uhle's ketone (4c) became easily accessible from 3-indol epropionic acid by Goto's method. ${ }^{12}$ In connection with our attempt to find a reasonable total synthesis of ergoline skel eton we wished to reinvestigate the cyclization of ring $D$. We had reported the first successful reaction sequence to this end by applying an unprecedented intramolecular Stobbe condensation taking advantage of a lithium complex formed as an intermediate. ${ }^{13}$ As a second approach, ring D of the tetracyclic skeleton was formed by an intramolecular Dieckmann condensation of a diester, obtained in a modified Reformatsky reaction of a properly substituted derivative of 4c, followed by elimination of water. ${ }^{14}$ Neither of these methods, however, could be further elaborated to achieve (+)-lysergic acid.

[^2]SCHEME 2. Synthesis of 4-Bromo-Uhle's Ketone (4g) from $3^{a}$

a Reagents and conditions: (a) (1) powdered $\mathrm{KOH}+$ Piv-CI, $\mathrm{CH}_{2} \mathrm{Cl}_{2}+\mathrm{THF}$, (2) $\mathrm{SOCl}_{2}$, (3) $\mathrm{AlCl}_{3}+\mathrm{ClCH}_{2} \mathrm{COCl}, \mathrm{CH}_{2} \mathrm{Cl}_{2}(43 \%$, overall); (b) ref 15 ( $85 \%$ ); (c) $\mathrm{HO}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{OH}, \mathrm{p}$-TSA, benzene, reflux, $6 \mathrm{~h}(81 \%)$; (d) $\mathrm{MeNH}_{2}, \mathrm{CHCl}_{3}, 10-15{ }^{\circ} \mathrm{C}, 3-4 \mathrm{~h}(88 \%)$; (e) aq HCl (1 M), acetone, rt, 3 h ( $97 \%$ ).

## SCHEME 3. Synthesis of Tetracyclic Ketone [(+)-7] ${ }^{\text {a }}$

a Reagents and conditions: (a) $\mathbf{5}+\mathbf{4 d}$, toluene, $48 \mathrm{~h}, \mathrm{rt}$ (35\%); (b) $\mathbf{5}+\mathbf{4 g}$, THF, 24 h , rt ( $56 \%$ ); (c) MeNH , benzene, $10-15{ }^{\circ} \mathrm{C}, 1$ $\mathrm{h}(80 \%)$; (d) aq $\mathrm{HCl}(6 \mathrm{M}), 35-40{ }^{\circ} \mathrm{C}, 1 \mathrm{~h}$ then (e) $\mathbf{6 c}$ in $\mathrm{CHCl}_{3}$, $\mathrm{LiBr}+\mathrm{TEA}, 0-5{ }^{\circ} \mathrm{C}, 12 \mathrm{~h}(60 \%, 2$ steps); (f) ( - )-dibenzoyl-Ltartaric acid, $\mathrm{CH}_{3} \mathrm{CN}+\mathrm{H}_{2} \mathrm{O}$ (1:1) (38\%).

To our pleasant surprise we found that bromoketone 4d, ${ }^{15}$ contrary to the literature, ${ }^{10}$ can be subjected to a substitution reaction with amine 5 providing us with the so far unknown, but much sought-after, even mistakenly claimed ${ }^{9}$ product ( $\mathbf{6 a}$ ), if one has the patience to allow the reaction to proceed at ambient temperature in toluene. The amine component (5) was already known and could easily be prepared. ${ }^{16}$ After a simple deacylation with methylamine and subsequent deprotection of the ketone the desired compound $\mathbf{6 c}$ was for the first time in our hands. The yield was even better if we allowed amine 5 to react with the N -unprotected bromoketone $\mathbf{4 g}$, which had been prepared via ketalization of 4d, N-deacetylation, and a deketalization step in high yields. This sequence yielding $\mathbf{6 b}$ and leading from here to $\mathbf{6 c}$ proved to be a real shortcut.

The ring closure of 6c leading to the unsaturated ketone $\mathbf{7}^{17}$ by intramolecular aldol condensation seems

[^3]to be an easy task, but with a great number of wellestablished agents (from potassium tert-butoxide through super bases to LHMDS) not even a trace of the desired teracyclic compound could be detected. It is worth noting, and not easy to explain, that in the dihydro-indole series this ring closure had been carried out; ${ }^{16}$ however, similar intramolecular ring closure of compounds with a sulfone group instead of indole nitrogen also failed. An analogous compound of $\mathbf{6 c}$ having an indole N -tosyl group and an acetyl group on the second nitrogen in place of the methyl group could be closed by KF , but simultaneously isomerization into a naphthalene derivative al so occurred. ${ }^{18} \mathrm{We}$ became successful in performing the reaction by using a $\mathrm{LiBr}+$ triethylamine system, which was first used for condensation by Eschenmoser in the case of a different, sulfur-containing compound. ${ }^{19} \mathrm{LiBr}$ or triethylamine alone were totally ineffective. Likely the LiBr leads to a complementary activation of the two carbonyl groups in the presence of basic amine, since lithium ions have a higher affinity toward oxygen than nitrogen. The function of the amine is purely to abstract the proton in the $\alpha$-position with respect to the O-complexed ketone carbonyl. An especially good result was achieved by performing the two consecutive steps (deprotection and ring closure; $\mathbf{6 b} \rightarrow \mathbf{6 c} \rightarrow \mathbf{7}$ ) without isolation of the intermediate $\mathbf{6 c}$ to give a 60\% combined yield of crystalline unsaturated ketone 7.

The resolution of $\mathbf{7}$ was performed with dibenzoyltartaric acid. At the same time the optically active ketone was also prepared by degradation of natural lysergic acid, ${ }^{20}$ and by comparison the absolute configuration of our synthetic compounds was established.

To proceed, we allowed the optically active $\mathbf{7}$ to react with the isonitrile derivative $\mathbf{8}$ in the presence of base ${ }^{21}$ to yield the formamide derivative 9, followed by acidic hydrolysis. A mixture of lysergic acid (2a) and its epimer (2b) was obtained; after treatment with base almost pure (+)-lysergic acid was isolated as a result of epimerization, although in poor yield.

A much better result was achieved by treating intermediate 9 with base affording a mixture of nitriles (2c: 2d, 1:1, 70\%) and converting the mixture by Pinner reaction into lysergic acid ester diastereomers (a 3:2 mixture of $\mathbf{2 e}: \mathbf{2 f}, \mathbf{7 2 \%}$ ). There is no need to separate the two nitriles or esters, since the basic hydrolysis of the mixture of 2e:2f results in pure (+)-lysergic acid (2a) through concurrent hydrolysis and epimerization. ${ }^{22}$
(2) Improving the Efficiency of the Peptide Part Synthesis. Above we described the synthesis of the (+)-

[^4]SCHEME 4. Synthesis of (+)-Lysergic Acid (2a) from (+)-7a

a Reagents and conditions: (a) ( + )-7 $+\mathbf{8}$, t-BuOK, THF + $\mathrm{t}-\mathrm{BuOH}, 0^{\circ} \mathrm{C}, 20 \mathrm{~min}$ then $+\mathrm{H}_{2} \mathrm{O},-5^{\circ} \mathrm{C}(77 \%)$; (b) aq $\mathrm{HCl}(2 \mathrm{M})$, reflux, 30 min (13\%); (c) $\mathrm{NaOMe}, \mathrm{MeOH}, 70-75^{\circ} \mathrm{C}, 30 \mathrm{~min}(70 \%)$; (d) $\mathrm{HCl} / \mathrm{MeOH}(6.7 \mathrm{M}), 75-80^{\circ} \mathrm{C}, 45 \mathrm{~min}(72 \%)$; (e) aq NaOH ( 5 M), $\mathrm{MeOH}, 70-80^{\circ} \mathrm{C}, 2.5 \mathrm{~h}$ then aq $\mathrm{HCl}(6 \mathrm{M})$ to pH 6.5 ( $54 \%$ ).
lysergic acid component of $\alpha$-ergocryptine (1). The synthesis of the peptide part has already been described ${ }^{23}$ by a research group from the Sandoz Pharmaceutical Co. Our task was to improve the efficiency, especially the stereoefficiency of the reaction sequence, and to make a scale-up procedure possible.

At the outset isopropyl malonic ester was oxidized by benzoyl peroxide. According to the original procedure the excess of the benzoyl peroxide was to be eliminated by charcoal, but following this route we observed explosions in about $20 \%$ of the cases. To avoid this danger, $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ or $\mathrm{NaHSO}_{3}$ was successfully used instead of charcoal. The resulting compound was debenzoylated, and the hydroxyl group was protected as the benzyl ether. Partial hydrolysis of diester $\mathbf{1 0}$ gave rise to the half ester ( $\pm$ )-11. In Sandoz's original reaction sequence this acid was resolved by the consecutive application of ( - )- and (+)-pseudoephedrine, which process proved to be rather inconvenient and the yield low. Instead of pseudoephedrines we used (+)-1S,2S-2-amino-1-(4-nitrophenyl)propan-1,3diol (12) for resolution. Compound $\mathbf{1 2}$ is the unwanted and thus discarded enantiomer formed during the manufacturing procedure of the antibiotic chloramphenicol. ${ }^{24}$ The desired salt of the R-(+)-isomer [(+)-11)] crystallized from the solution in excellent yield. Isolation of $(+)$ - $\mathbf{1 1}$ has been accomplished by acidic treatment. By this method both (-)-11 and $\mathbf{1 2}$ were recovered easily.

To make the process even more economic, the unwanted S-enantiomer [(-)-11] was esterified with diethyl sulfate to 10. Through this procedure we obtained the original, achiral diester, which we can recycle into the reaction sequence. We may call this manipulation dechiralization.

[^5]
## SCHEME 5. Modified Resolution of ( $\pm$ )-11a

a Reagents and conditions: (a) ref 23; (b) ( $\pm$ )- $\mathbf{1 1}+\mathbf{1 2}$, EtOH, rt, $12 \mathrm{~h}[(+)-\mathbf{1 1}, 38 \% ;(-)-\mathbf{1 1}, 39 \%]$; (c) (EtO) $)_{2} \mathrm{SO}_{2}$, acetone, refl., 3 h (90\%).

The so-called aminocyclol hydrochloride (14), the partner needed for coupling with (+)-Iysergic acid, was prepared from Z-protected proline. The proline derivative was treated with L-leucine methyl ester p-tolyl sulfonate salt using the mixed anhydride (chloroformic acid ester) method. After deprotection by hydrogenol ysis foll owed by heating, the L-prolyl-L-leucyl lactam (13) was isolated in good yield.
The malonic acid derivative $[(+)-11]$ was transformed to the acid chloride and allowed to react with lactam 13, then deprotected by hydrogenolysis, and the resulting cyclolester hydrolyzed to the so-called cyclolcarboxylic acid. After several steps 14 was obtained. ${ }^{23}$
Several methods were tried for coupling lysergic acid (2a) with the peptide part (14). The most practical route was found by using lysergic acid trifluoroacetate, which was allowed to react with $\mathrm{PCl}_{5}$. The reaction conditions (temperature, the excess of reagent) are critical. The approximate amount ( $80 \%$ ) of acyl chloride in the obtained reaction mixture was estimated by IR spectra. By reacting the suspension of the aminocyclol hydrochloride in methylene chloride with lysergic acid chloride hydrochloride ${ }^{25}$ at $-12{ }^{\circ} \mathrm{C}$ in the presence of pyridine, $\alpha$-ergocryptine (1) was isolated in $41 \%$ yield (as its phosphate salt). ${ }^{26}$ In addition to its diastereomer $\alpha$-ergocryptinine (15) was obtained (31\%) after chromatographic workup. ${ }^{23}$

Since a thermodynamic equilibrium exists between the two stereoisomers in favor of $\mathbf{1}$ to $\mathbf{1 5}$ (3:1) in boiling methanol or in other solvents, ${ }^{27}$ in principle there is a possibility to transform $\mathbf{1 5}$ into $\mathbf{1}$ in preparative scale. This aspect, however, was not closely investigated.

## Conclusion

We have shown that a practical, direct synthesis of (+)lysergic acid is possible while maintaining the indole ring

[^6]
## SCHEME 6

## SCheme 7

15 ( $\alpha$-ergocryptinine)
intact throughout the synthesis, thus avoiding the necessity of introducing a needless chiral center by reduction. Furthermore we could perform the resolution of an earlier intermediate, thus avoiding the rather tedious and uneconomic resolution of the end product. Since several natural al kaloids [(+)-isosetoclavine, ${ }^{20 a}(+)$-lysergene, ${ }^{28}$ $(-)$-agroclavine $\left.{ }^{28}\right]$ have been synthesized via a semisynthesis from $(+)-7$ obtained by degradation of natural ( + )lysergic acid, ${ }^{20}$ the above approaches from now on can be regarded as the total syntheses of said al kaloids.

By using our modified approach, the peptide part of the alkaloid was synthesized without any side product having the undesired enantiomeric structure, i.e., (-)-11, since the latter was successfully recycled.

Upon coupling the two parts, we have completed an efficient total synthesis of $\alpha$-ergocryptine and $\alpha$-ergocryptinine.

## Experimental Section

N-Piv-Uhle's ketone (4c; modified procedure). To a cold $\left(0-5^{\circ} \mathrm{C}\right)$ solution of $\mathbf{3}(25.0 \mathrm{~g}, 132.0 \mathrm{mmol})$ in a mixture of dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1.32 \mathrm{~L})$ and THF ( 63 mL ) were added tetrabutylammonium hydrogen sulfate ( $5.25 \mathrm{~g}, 15.4 \mathrm{mmol}$ ) and powdered $\mathrm{KOH}(25.0 \mathrm{~g}, 446.2 \mathrm{mmol})$. After the mixture was stirred for 15 min at the above temperature, pivaloyl chloride ( 67.5 mL , 0.54 mol ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 125 mL ) was added dropwise. The mixture was stirred for 2 h at room temperature, then cooled again and poured into a mixture of cold water ( 0.8 L ), aq HCl solution ( $1 \mathrm{M}, 75 \mathrm{~mL}$ ), and $\mathrm{CHCl}_{3}(625 \mathrm{~mL})$. The aqueous phase was extracted with $\mathrm{CHCl}_{3}(0.5 \mathrm{~L})$, and the combined organic phase was washed with cold water $(2 \times 0.75 \mathrm{~L})$ and dried. The solvent was evaporated and the residue purified by vacuum distillation ( $100^{\circ} \mathrm{C}, 1 \mathrm{mmHg}$ ) to remove excess reagent. The obtained crude product ( 28 g ) was dissolved in thionyl chloride ( $37.0 \mathrm{~mL}, 309 \mathrm{mmol}$ ) with stirring for 15 min at room temperature, then evaporated under reduced pressure. The residue was dissolved in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(260 \mathrm{~mL})$ and dropped (during 0.5 h ) into a mixture of aluminum chloride ( 36.0 g , 270 mmol ) and chloroacetyl chloride ( $32.0 \mathrm{~mL}, 0.4 \mathrm{~mol}$ ) in dry dichloromethane $(300 \mathrm{~mL})$ at $0-5^{\circ} \mathrm{C}$. The mixture was stirred for 2 h at room temperature, then poured into a mixture of crushed ice ( 0.5 kg ), $\mathrm{CHCl}_{3}(1.5 \mathrm{~L})$, and brine ( 1 L ). After extraction, the organic phase was washed with brine ( $2 \times 0.75$ L ) and cold water ( 0.75 L ) and dried. The crude product was crystallized from ethanol ( 150 mL ) to yield 4 c ( $14.5 \mathrm{~g}, 43 \%$ ), in full agreement with the reported data. ${ }^{8 a} \mathrm{Mp}: 167-168{ }^{\circ} \mathrm{C}$.

Resolution of $( \pm)$-7. To a solution of $( \pm)$-7 ( $595 \mathrm{mg}, 2.5$ mmol ) in a mixture of acetonitrile and water ( $1: 1,25 \mathrm{~mL}$ ) at $60{ }^{\circ} \mathrm{C}$ was added ( - )-di benzoyl-L-tartaric acid ( $895 \mathrm{mg}, 2.5$ $\mathrm{mmol})$ in the same mixture of sol vents ( 12.5 mL ). The mixture was stirred for $10-15 \mathrm{~min}$ at the above temperature, then cooled to room temperature while being stirred for about an additional 0.5 h . The mixture was kept in a refrigerator overnight. The precipitated crystals were filtered off and washed with the above solvent mixture ( 5 mL ) to yield 585 $\mathrm{mg}(79 \%)$ of salt. $[\alpha]_{\mathrm{D}}+271$ (c $0.265, \mathrm{MeOH}$ ). This salt ( 515 $\mathrm{mg}, 0.864 \mathrm{mmol}$ ) was suspended in a mixture of $\mathrm{CHCl}_{3}(200$ mL ) and water ( 30 mL ) at $0-5^{\circ} \mathrm{C}$ and the pH was adjusted to $\approx 9$ with aq NaOH solution ( $1 \mathrm{M}, 2 \mathrm{~mL}$ ). After the phases were separated, the aqueous phase was washed with $\mathrm{CHCl}_{3}(2 \times$ 50 mL ). The combined organic phases were washed with water, dried, and evaporated. The residue was crystallized (hexane/ ether, 1:1, 10 mL ) to yield ( + )-7 ( $226 \mathrm{mg}, 38 \%$ ) as a yellow crystal. Mp: $165-169^{\circ} \mathrm{C} .[\alpha]_{\mathrm{D}}+686$ (c $0.5, \mathrm{MeOH}$ ).

Isolation of (-)-7. The mother liquor of the first crystallization was evaporated in vacuo until an aqueous solution was obtained. The solution was diluted with water ( 50 mL ) and $\mathrm{CHCl}_{3}(300 \mathrm{~mL})$ and cool ed at $0-5^{\circ} \mathrm{C}$. The pH of the mixture was adjusted to $\approx 9$ with aq NaOH solution ( $1 \mathrm{M}, 3 \mathrm{~mL}$ ). After the phases were separated, the organic phase was washed with water, dried, and evaporated. The residue was crystallized (hexane/ether, 1:1, 10 mL ) to yield crude ( - )-7 (306 mg) as a

[^8]solid. [ $\alpha]_{\mathrm{D}}-359$ (c 0.5, MeOH). This product ( $299 \mathrm{mg}, 1.256$ mmol) was resolved with (+)-dibenzoyl-d-tartaric acid as described above to yield 262 mg of salt (35\%). [ $\alpha]_{D}-364$ (c $0.25, \mathrm{MeOH}$ ). The salt was treated with aq NaOH in $\mathrm{CHCl}_{3}$ as desribed above and the crude product was crystallized to afford $118 \mathrm{mg}(20 \%)$ of ( - )-7. Mp: $165-168{ }^{\circ} \mathrm{C}$. [ $\left.\alpha\right]_{\mathrm{D}}-696$ (c $0.5, \mathrm{MeOH}$ ).

Preparation of (+)- E/Z-Formamide 9. To a solution of $(+)-7$ ( $453 \mathrm{mg}, 1.9 \mathrm{mmol}$ ) in dry THF ( 10 mL ) at room temperature were added p-toluenesulfonylmethyl isocyanide ( $374 \mathrm{mg}, 1.9 \mathrm{mmol}$ ) then t-BuOK ( $426 \mathrm{mg}, 3.8 \mathrm{mmol}$ ) in a mixture of THF $(5 \mathrm{~mL})$ and t -BuOH $(2 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. After being stirred for 20 min , the mixture was cooled to $-5^{\circ} \mathrm{C}$, diluted with water ( 50 mL ), and extracted with $\mathrm{CHCl}_{3}(3 \times 50 \mathrm{~mL})$. The combined organic phases were washed with brine and dried. The crude product was crystallized (hexane/ether, 1:1, 10 mL ) to afford 637 mg ( $77 \%$ ) of 9 as a cream-colored solid. (b) Acidic Hydrolysis of (+)-9 and Epimerization. Formamide 9 ( 0.5 g , 1.1. mmol) was dissolved in aq HCl solution ( $2 \mathrm{M}, 40 \mathrm{~mL}$ ) and refluxed for 30 min . After cooling, the pH of the solution was adjusted to 6.5 with aq saturated $\mathrm{NaHCO}_{3}$ solution and evaporated in vacuo to dryness. The residue ( $140 \mathrm{mg}, 45 \%$ ) was purified by chromatography (eluent: $\mathrm{CHCl}_{3} / \mathrm{MeOH} / \mathrm{cm}^{3} \mathrm{NH}_{4} \mathrm{OH}$ solution, 5:5:0.1) to afford 50 $\mathrm{mg}(13 \%)$ of $\mathbf{2 a} \mathbf{2} \mathbf{2 b}$. The NMR data of $\mathbf{2 a}$ have been described above, and the chemical shifts of $\mathbf{2 b}$ were determined from the mixture.
${ }^{1}{ }^{H}$ NMR (DMSO-d ${ }_{6}, 400 \mathrm{MHz}$ ): $\delta 2.46\left(3 \mathrm{H}, \mathrm{s}, \mathrm{NCH}_{3}\right), 2.48$ ( $1 \mathrm{H}, \mathrm{m}, \mathrm{H}-4_{\alpha}$ ), $2.67\left(1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=12.0,4.6 \mathrm{~Hz}, \mathrm{H}-7_{\beta}\right), 3.02(1 \mathrm{H}$, $\mathrm{m}, \mathrm{H}-5), 3.20\left(1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=12.0,2.8 \mathrm{~Hz}, \mathrm{H}-7{ }_{\alpha}\right), 3.24(1 \mathrm{H}, \mathrm{m}$, $\mathrm{H}-8), 3.40(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-4 \beta), 6.43(1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=5.5,1.8 \mathrm{~Hz}, \mathrm{H}-9)$, $7.02-7.07(3 \mathrm{H}, \mathrm{m}, \mathrm{H}-2, \mathrm{H}-13$ and $\mathrm{H}-14), 7.13(1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=6.9$, $1.6 \mathrm{~Hz}, \mathrm{H}-12), 10.75$ (1H, br s, NH). ${ }^{13} \mathrm{C}$ NMR (DMSO-d 6,100 $\mathrm{MHz}): \delta 26.9(\mathrm{C}-4), 41.2(\mathrm{C}-8), 43.3\left(\mathrm{NCH}_{3}\right), 54.1(\mathrm{C}-7), 62.9$ (C-5), 109.23 (C-3), 110.66 (C-12), 111.78 (C-14), 119.42 (C-9), 120.19 (C-2), 123.0 (C-13), 126.5 (C-16), 128.0 (C-11), 134.44 (C-15), $135.90(\mathrm{C}-10), 174.36\left(\mathrm{CO}_{2} \mathrm{H}\right)$.

In the next step $100 \mathrm{mg}(0.37 \mathrm{mmol})$ of $\mathbf{2 a} \mathbf{a} \mathbf{2 b}$ was dissolved in MeOH ( 10 mL ) at room temperature and KOH ( 100 mg , 1.8 mmol ) was added in a mixture of $\mathrm{MeOH}(2 \mathrm{~mL})$ and water ( 1 mL ). The mixture was stirred for 48 h , then a further portion of KOH ( 100 mg in the same solvents) was added, and the mixture was stirred for 48 h . The solution was acidified to pH 6.5 with aq HCl solution ( 1 M ) and evaporated in vacuo to dryness. The residue was purified by chromatography (eluent: $\mathrm{CHCl}_{3} / \mathrm{MeOH} / \mathrm{cm}^{3} \mathrm{NH}_{4} \mathrm{OH}$ solution, 5:5:0.1) to afford 50 $\mathrm{mg}(50 \%)$ of $\mathbf{2 a}$.

Resolution of ( $\pm$ )-11. To a solution of $( \pm)$ - $\mathbf{1 1}(77.2 \mathrm{~g}, 0.276$ mol ) in dry EtOH ( 0.5 L ) was added 12 ( $58.45 \mathrm{~g}, 0.276 \mathrm{~mol}$ ) at room temperature. The mixture was stirred for a few minutes, then kept at room temperature overnight. The precipitated crystals were filtered off, washed with cold EtOH, and recrystallized from EtOAc ( 1.8 L ) to afford $54 \mathrm{~g}(80 \%)$ of salt. Mp: 145-147 ${ }^{\circ} \mathrm{C}$. $[\alpha]_{\mathrm{D}}+30.7$ (c 2, acetone). To a suspension of the above salt ( 54 g ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(240 \mathrm{~mL})$ were added crushed ice ( 100 g ) and phosphoric acid ( $85 \%, 19.4 \mathrm{~mL}$ ). After the solution was stirred for a few minutes, the phases were separated. The aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (3 $\times 200 \mathrm{~mL}$ ). The combined organic phase was washed with aq HCl solution ( $2 \mathrm{M}, 2 \times 100 \mathrm{~mL}$ ) and water and dried. The solvent was removed under reduced pressure to yield 29.2 g (38\%) of (+)-isopropylbenzyloxymal onic acid monoethyl ester $[(+)-11]$ as a colorless oil. [ $\alpha]_{\mathrm{D}}+8.1$ (c 5, EtOH). (Compound 12 could be recovered from the aqueous phase.)

The mother liquor formed after the first crystallization and recrystallization was evaporated in vacuo to dryness. The obtained oily salt ( 80 g ) was treated with phosphoric acid in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ as described above to afford 35.4 g (39\%) of ( - )-11 as a crude product.
(36) In DMSO-d ${ }_{6}$ solution 2a experienced a rapid C-8 epimerization and as a result $\mathbf{2 b}$ appeared in the isomer mixture.

Dechiralisation of (-)-11. To a solution of $(-)-\mathbf{1 1}(35 \mathrm{~g}$, 125 mmol ) in dry acetone ( 0.5 L ) were added dry $\mathrm{K}_{2} \mathrm{CO}_{3}$ (34.5 $\mathrm{g}, 0.25 \mathrm{~mol}$ ) and diethyl sulfate ( $24.6 \mathrm{~mL}, 187 \mathrm{mmol}$ ). The mixture was heated to reflux for 3 h , then cooled to room temperature and poured into cold water ( 1 L ). The resulting oil was separated and the aqueous phase was extracted with ether $(2 \times 100 \mathrm{~mL})$. The combined organic phase was washed with aqueous $\mathrm{NaHCO}_{3}$ solution ( $5 \%, 2 \times 100 \mathrm{~mL}$ ) and water and dried. The solvent was removed under reduced pressure and the crude product ( 41.3 g ) was purified by distillation (bp: $130-134{ }^{\circ} \mathrm{C}, 0.5 \mathrm{mmHg}$ ) to give $34.8 \mathrm{~g}(90 \%)$ of isopropylbenzyloxymalonic acid diethyl ester (10).

Acknowledgment. The Found OTKA T-046015 is gratefully acknowledged. Special thanks are due to Dr. Ágnes Gömöry for the MS spectra and Ms. Gabriella Hanek and Ms. Mónika J eruska for technical assistance.

Supporting Information Available: ${ }^{10} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra for 1, 2a-f, 4c-g, 6a-c, ( $\pm$ )-7, 9, 10, (+)-11, 13, and 14. This material is available free of charge via the Internet at http://pubs.acs.org.

    (12) (a) Teranishi, K.; Hayashi, S.; Nakatsuka, S.; Goto T. Tetrahedron Lett. 1994, 35, 8173-8176. (b) Although Goto's method has given a really short route to tetracyclic $\mathbf{4 a}$ and $\mathbf{4 c}$, the application of the expensive and dangerous $\mathrm{n}-\mathrm{BuLi}$ at $-78^{\circ} \mathrm{C}$ can interfere with their scale-up preparation. In our modification powdered KOH was applied for deprotonation of $\mathbf{3}$ at $0^{\circ} \mathrm{C}$. After acylation at room temperature, the obtained crude product was transformed directly to 4c in 43-46\% overall yield.

[^7]:    (28) Wheeler, W. J. Tetrahedron Lett. 1986, 27, 3469-3470.

[^8]:    (29) The formation of ring $D$ was confirmed by the presence of an NOE effect between $\mathrm{H}-9$ and $\mathrm{H}-12$ protons. The chemical shifts of $\mathrm{C}-9$ and C-10 carbons (118.8 and 156.0 ppm, respectively) are also characteristic for an $\alpha \beta$-unsaturated ketone unit.

[^9]:    (30) Evidence for the given stereochemistry of the double bond in 9 was provided by NOE experiments. Irradiation of the $\mathrm{H}-7_{\beta}$ proton ( 3.37 ppm ) leads to observation of an NOE at the formyl proton ( 8.09 ppm ), while the tosyl protons gave NOE with H-9 (7.88 ppm).
    (31) The $\beta$-orientation of the nitril group at $\mathrm{C}-8$ follows from the vicinal coupling constant $(10.4 \mathrm{~Hz})$ between $\mathrm{H}-8$ and $\mathrm{H}-7_{\beta}$ protons.

[^10]:    (32) The configurational change at $\mathrm{C}-8$ in comparison with $\mathbf{2 c}$ is confirmed by the coupling constant values of $\mathrm{H}-8$ with $\mathrm{H}-7_{\alpha}$ and $\mathrm{H}-7_{\beta}$ ( 3.0 and 3.4 Hz , respectively).
    (33) The configuration at C-8 was determined by the NOE effect between $\mathrm{H}-8$ and $\mathrm{H}-7_{\alpha}$, and by the value of the coupling constant between $\mathrm{H}-8$ and $\mathrm{H}-7_{\beta}$ protons $(10.5 \mathrm{~Hz})$.
    (34) (a) Smith, S.; Timmis, G. M. J. Chem Soc. 1936, 1440-1444. (b) J acobs, W. A.; Craig, L. C. J. Biol. Chem. 1934, 104, 547-549.
    (35) The epimerization at $\mathrm{C}-8$ is best reflected by the values of the coupling constants between $\mathrm{H}-8$ and $\mathrm{H}-7_{\alpha}$ and $\mathrm{H}-7_{\beta}$ protons.
